

UX & *user flows*

First-run onboarding, the daily session loop, the trade-focus pivot, and the dashboard information architecture — designed around one habit: open the app, check if the market is hot, spend a session well.

Doc	Date	Design language
04 of 06 — UX & flows	2026-08-24	Trading terminal · dark-only · emerald

The terminal aesthetic stays — the rules get written down

VISUAL SYSTEM OF RECORD (FRONTEND/DESIGN.MD — SHIPPED, KEEP) • "Terminal-grade restraint": near-black neutral canvas, crimson as the single brand hue (deep maroon fills, never full-bright red buttons), depth via hairlines — no shadows or glows as structure. • Emerald and red are reserved for P&L semantics only — untouchable by branding. Amber = warning, blue = info. • Geist for UI, Geist Mono for every number (tabular, slashed zero); Instrument Serif italic for hero-scale accent words only. • Dark-only, radii strictly 4/6/8px, motion restrained (150ms color transitions; bounce/shine/gradient-text banned).		NON-NEGOTIABLE UX RULES • No fabricated numbers. Every value traces to the backend or shows an honest empty/loading/error state. A dash is better than a guess. • Every wait is explained. Session synthesis in progress, engine warming up, proposal expiring — each has visible state, never a dead spinner. • Money actions confirm once, clearly — amount, worst-case loss, venue — then execute without ceremony. • The agent is visible. Users see what the system is doing (scanning, gating, watching) — trust comes from legibility, not claims. • Paper mode is labeled everywhere — a persistent chip, so nobody mistakes simulation for money.	
CANVAS LADDER oklch .135 → .2 background → surface → elevated, neutral	BRAND crimson · hue 26 accent ramp 50–700; fills use deep maroon	P&L ONLY profit / loss emerald + red — untouchable by branding	NUMERALS 0123.45 Geist Mono via .num — every number, tabular

Onboarding: Google in, five questions, trading in under two minutes

The daily loop: check heat → spend a session → let the monitor work

Dashboard: heat up top, session in the center, agent always visible

WHY THIS LAYOUT

- **Banner owns the top** — the daily question ("trade now?") is answered before any click.
- **Session panel is the stage:** its state drives the page; everything else is periphery.
- **Agent window is always on** — even outside sessions it shows monitor heartbeats, so the product never looks dead.
- **Terminal stays a separate page** for chart-first users; dashboard is decision-first.

THE PROPOSAL CARD (THE PRODUCT'S FACE)

- LONG BTC · entry / stop / 2 targets · size & leverage · **R:R 2.4** · risk ₹812
- Two-line rationale in plain language + "what invalidates this"
- Shelf-life ring counting down · **Approve** (success-tinted, per DESIGN.md) / Pass (ghost)
- Approve = one confirm with worst-case loss, then execution state inline

Trade focus: when money is on the line, the UI has one subject

POSITION HERO

LONG BTC-PERP · +₹1,204 (+1.1R) · entry 67,240 · mark 67,912 · SL 66,800 → **tightened to 67,350** · TP1 hit ✓ · TP2 69,100 · elapsed 00:47

CHART WITH TRADE LEVELS

Entry/SL/TP drawn on the live chart; monitor's invalidation level shown as a labeled line — the user sees exactly what the agent watches

MONITOR VERDICT LOG

"13:02 thesis intact — structure holding · 13:17 TP1 filled, stop → breakeven · 13:29 pulse cooling, watching invalidation"

MANUAL CONTROLS

Close now · Move stop (tighten-only on free) — user always outranks the agent

STATUS FOOTER

"Session complete — slot spent well · monitor on duty" · next-slot status (held while the trade runs)

INTERACTION RULES

- Trade focus is a **derived state** — open position + monitor status. The session *ended* the moment the trade opened (slot spent well); there is no session clock here to expire.
- Monitor actions (tighten, partial, exit) appear as **verdicts with reasons**, timestamped, read from the append-only `monitor_events` trail — persisted, so the story survives restarts and feeds the exit recap.
- Manual close always available, one confirm, shows realized P&L instantly.
- The one banner: "**session complete — your monitor is on duty.**"

EXIT RECAP (THE RETENTION MOMENT)

On close, a recap card: outcome in R and ₹, what the monitor did and why, updated equity curve, and — when slots remain and the market is still hot — "**1 session left today**". Every exit hands the user a reason to come back.

Frontend build map — most of the skeleton already exists

EXISTS ON HEAD (VERIFIED: TSC CLEAN, 99/99 VITEST)

- **Full session phase machine** — idle / blocked / exhausted / scanning / proposal / executing, live countdown + quota bar, heartbeat-staleness honesty, persistent SessionBar on every route
- **ProposalCard with approve/reject** — shelf-life countdown, derived (never asserted) order destination
- Auth incl. Google OAuth (currently placed *below* the email form)
- 2-step onboarding: trading mode + exchange connect (BingX VST, Delta India testnet, verified-before-store vault)
- Desk: KPI band, equity curve, AI signals, recent trades · full Portfolio page · /chart terminal
- AgentFeed on the live agent_activity stream (renders only inside a scanning session)

TO BUILD / FIX (ORDERED — SEE ROADMAP, DOC 06)

- **Hot-window banner + pulse strip** — net-new; needs the new `/api/pulse`
- **Trade-focus pivot** — add a "watching" phase (today: approve → "Placing your trade..." → falls back to idle); re-mount the orphaned, feature-complete `ActiveTrades` widget as the focus surface + monitor verdict log
- **Onboarding steps 3–5** (capital · risk · monthly goal) — `trading_capital` has no UI anywhere; reuse TradingPersona's form model
- **Session slots UI** (2 × 30 min) replacing the minutes bar
- **Google-first reorder** on login + signup
- **Session + exit recap** cards
- Fixes: forgot-password 404 · stale "Agents tab" copy (×2) · standing agent window on Desk (mount AgentFeed outside sessions)

QUALITY BAR (EVERY NEW COMPONENT)

Loading, empty, and error states designed before the happy path · mobile-responsive (session + trade focus must work one-handed on a phone) · mono numerals for money · no value rendered without a backend source · Vitest coverage for state logic, Playwright for the session happy path.
