

The product, *refocused*

One clear promise for 50 waitlist users: metered AI trading sessions that find a trade, and an always-on agent that manages it after entry. Free to run, honest about its edge, shippable now.

Doc	Date	Status	Supersedes
02 of 06 – Product plan	2026-08-24	Adopted direction	Tier table in docs/HLD.md §5

What CryptAI is — and the three promises it can keep

An AI trading co-pilot for crypto perpetual futures. The user brings an exchange account (or a paper desk); CryptAI brings a validated market-condition engine, a metered session where AI agents propose trades, and an unmetered monitor that manages every open position.

● PROMISE 1 · TIMING

"Is now a good time to trade?"

Answered by the Rust signal engine's **tradability score** — empirically validated as a short-horizon filter (IC +0.08–0.10), not vibes. Surfaced as a **hot-window banner**: spend your session slots when the market is actually tradable.

● PROMISE 2 · PERSONAL

"A trade team working your book."

Setups are synthesized **per user** — same chart, different trade — sized against your capital, risk appetite, monthly goal, and open positions. Every trade arrives as a proposal with entry, stop, targets, size, and a plain-language rationale. **You approve; it executes.**

● PROMISE 3 · VIGILANCE

"It doesn't fall asleep after entry."

On fill, a per-position **monitor agent** takes over — unmetered, outliving the session and every restart. It re-checks the thesis as conditions drift and decides: hold, tighten stop, take partial, or exit. **Finding trades is metered; protecting them never is.**

THE ONE-LINE PITCH

"Up to two 30-minute sessions a day with a professional AI trade desk — a slot is only spent when it delivers you a trade, and an agent watches every position you take, around the clock, for free."

Free tier: 2 × 30-minute sessions, one trade in focus

Four tiers — only Free ships now, the rest is roadmap

No purchasable pricing until a real payment rail exists (Razorpay/Stripe — roadmap M4). The landing page presents Free as a beta and the paid tiers as "coming soon". Env-var tier grants are replaced by a subscriptions table before any money moves.

CAPABILITY	FREE — SHIPS NOW	LITE	PRO	PRO MAX
Sessions / day	2 × 30 min	4 × 45 min	8 × 60 min	Unlimited windows
Trade mode	Synchronous — 1 open trade, session pivots to it	Async-lite — 2 concurrent trades	Async — 5 concurrent trades	Async — 10 concurrent trades
Channels	Intraday	Intraday	+ Swing — only after it passes live validation (the +6-week walk-forward gate)	+ validated channels as they clear the gate
Execution	Paper desk; exchange connect in testnet beta	+ Live (Delta India), consent-gated	+ BingX · auto-mode within consent caps	+ Multi-exchange, API access
Monitoring	Unmetered on every tier — position protection is never paywalled			
Assistant	—	Ask about your positions	Full market + book Q&A	Full + strategy tuning
Price	\$0	TBD · after payments ship	TBD	TBD

Red-team correction (own honesty law): **scalp is not on the ladder at all** — it failed validation (weights flip at 12 bars) *and* India's 1% TDS kills its economics; swing IC is currently insignificant, so it is a validation-gated unlock, never marketed "coming soon". The honest paid axes are sessions, concurrency, live execution, and the assistant — never unvalidated channels.

The honest edge — claims the data supports

● WE CLAIM — AND CAN DEFEND

- "Now is / isn't a good time to trade." Tradability score validated out-of-sample as a short-horizon filter (IC +0.083–0.096 at 4 bars; survives volatility normalization; re-validated on six held-out symbols).
- "This setup fits your book." Sizing and gating are deterministic against the user's real capital, risk %, and open positions.
- "Your position is being watched." Monitor re-evaluates on regime flip, pulse veto, and invalidation breach — mechanical, auditable triggers.

● WE NEVER CLAIM

- **Direction from regime.** Killed out-of-sample (walk-forward IC –0.008). No consumer may map regime → long/short. Contract-tested.
- "3 PM will be the best hour." The score is a **now-cast**, not a forecast. The hot-window banner says "market is hot now" and "typically active hours" — never a predicted golden hour, until logged calibration data earns it.
- **Guaranteed returns.** Monthly range is the user's **goal input** for risk shaping — never a promise in UI copy.

● LAUNCH POSTURE: PAPER-FIRST

Waitlist launch runs on paper desks (real fills simulation) + Delta India testnet connect. Real-money mainnet stays double-gated off until the compliance floor exists (ToS, risk disclosure, automated-execution consent, API-key scope verification, KYC). Rationale:

- 50 strangers × leveraged perps × an engine with a **brand-new wiring layer** = uninsurable risk on day one.
- Paper mode exercises 100% of the product loop — sessions, proposals, focus mode, monitoring, history.
- India: FIU-IND / VDA / advisory-licensing questions are open; paper keeps them dormant while we learn.

FALSIFIABILITY FROM DAY ONE

- Every published pulse is appended to the `pulse_snapshots` calibration log — the score stays testable against forward returns.
- Every proposal → outcome pair is recorded, so "did our setups make money" is a query, not a belief.
- Hot-window hours are learned from our own logged data before we ever present them as advice.

Waitlist launch: must / should / won't

● MUST — LAUNCH BLOCKS ON THESE

- Google sign-in + 4-step onboarding (mode → capital → risk appetite → **monthly risk budget** — never a return expectation)
- Hot-window banner + per-symbol pulse on dashboard
- 2x30-min session flow: start → setups → proposal card → approve → trade focus
- Paper execution + portfolio/history that survives restarts
- Per-position monitor + visible monitor window ("what my agent is doing")
- Quota integrity: server-clamped sessions, per-session LLM budget fed & enforced
- Security floor: admin fail-closed, no fail-open anon mode, destructive scripts out of the image

● SHOULD — FIRST WEEKS AFTER

- Delta India **testnet** live-connect beta (real order path, fake money)
- Learned "typically hot hours" from calibration log
- Session summary recap ("your 30 minutes: 3 setups, 1 trade, +\$142")
- Email/push nudge when the market turns hot and slots remain
- Waitlist referral loop ("skip the queue")

● WON'T — DELIBERATELY NOT NOW

- Payments, paid tiers, checkout — Free beta only
- Real-money mainnet execution — gated until compliance floor
- Scalp channel — TDS honesty + validation gap
- AI chat assistant — Lite/Pro roadmap
- CoinDCX — no testnet exists; unvalidatable without real money
- Mobile app — responsive web only

How we'll know it worked — and what only the founder can decide

SUCCESS METRICS — FIRST 30 DAYS		
METRIC	TARGET	WHY IT MATTERS
Waitlist activation	≥ 60%	50 invited → 30 complete onboarding + first session
Active days	≥ 60%	Days with a session started or a slot held by an open trade — a good trade held 8h must not read as disengagement
Proposal delivery	≥ 50%	% of hot-window sessions receiving ≥1 proposal — the denominator that makes approval rate meaningful
Proposal approval rate	25–60%	Below = setups aren't credible; above = users rubber-stamp
D7 retention	≥ 40%	Sessions are a daily mechanic — this is the product verdict
Monitor saves	count > 0	Exits triggered by thesis-break before SL — the differentiator, demo-able
Request budget	< cap · 0 outages	OpenRouter requests/day vs key budget + sessions ended by capacity loss = 0 — dollars are \$0 by construction; requests are the real meter

FOUNDER DECISIONS NEEDED (BLOCKING NONE OF THE BUILD)

- **Waitlist geography:** India-only or global? Decides whether hot-window copy may say IST — internally everything is stored UTC and rendered in the viewer's local time.
- **Paper capital:** user-declared (capped \$1k–\$100k), with **desk epochs:** capital edits blocked while a position is open; an edit closes the desk epoch and opens a new logged one, so the proposal→outcome ledger can't be laundered by resets. All cross-user analysis in R-multiples and %.
- **Waitlist rollout:** all 50 at once vs 10/day cohorts. Plan assumes **cohorts of 10**.
- **Tier pricing:** deferred until payments ship — no number needed now.
- **Brand voice on hot windows:** "market is hot" vs "conditions favorable" — copy choice, compliance-relevant.
